August 29, 2014 For Immediate Release

A potential “game-changer” in the oil industry will be highlighted during a featured presentation at the 2014 Black Hills Bakken & Investor Conference October 1-2 at the Spearfish Holiday Inn Convention Center, Spearfish, SD.

Two western South Dakota entrepreneurs have created an innovative and environmentally friendly method of turning hazardous oil into safe and profitable oil. The company, Blue Bull, LLC, turns sour crude into sweet crude by removing Hydrogen Sulfide (H₂S) from the oil. Hydrogen Sulfide is the second-most-deadly, naturally occurring gas. It kills by paralyzing the nervous system area that controls the involuntary function of breathing. The result is lack of oxygen to the brain, followed by death in minutes.

Their first, fully operational processing plant has been in operation for a few months and they are processing approximately 2000 barrels of oil a day. The company’s patent pending processing system doesn’t just remove H₂S from oil; it eliminates it completely without residue or additional cleansing. Prior to their system, the only way to treat sour crude was with chemicals, which added between \$4 and \$15 per barrel. With chemical cleansing, H₂S is only reduced, not eliminated; and trace chemicals remain after the process. This new process leaves no chemical residue because chemicals aren’t used in any part of the process.
